BY
LOCAL TRUST COMMITTEE

November 13th, 2024

Dear Ms. Laura Patrick and Mr. Jamie Harris,

I am presenting to you the names and comments on a petition to put a **hold** on an application to put 85 truckloads of crushed rock, sand and gravel on Baker Road Beach. The petition, as stated below, asks for a study of the marine environment, open meetings and independent reviews of the project, that are easily accessible (and may I say readable?) to the public. Yesterday the petition had 1063 signatures and 74 comments* the majority of which are from islanders.

The Petition reads:

" **Baker Road Beach** is a much-loved public beach that is facing the imminent threat of being transformed. An application proposed by four oceanfront property owners intends to fill the beach and waters with 85 truckloads of coarse gravel, plus numerous large rocks. The affected area would stretch for over ½ km from the Quarry Drive Beach access to beyond the Baker Road steps.

We the undersigned, petition the Ministry of Water, Land and Resource Stewardship to put a hold on application file # 1415573 until such time as:

- **independent** professionals can review the application and publish their findings in such a way as to be easily accessible by all the residents of Salt Spring Island

- we publicly hear a response from all concerned First Nations.

- we publicly hear from **independent** marine biologists about the impact this may have on the Eelgrass beds, on the spawning grounds of Pacific Herring, Sand Lance, Surf Smelt and Plainfin Midshipman fish, and on the Great Blue Heron, Belted Kingfisher, River Otter and Bald Eagle nesting and hunting grounds.

- we are assured by **independent** engineers that the tons of shoreline fill (labeled shore "nutrition" in the application) will not shift and cover other areas of the beach --smothering the biodiversity of marine life on the beach.

- we publicly hear from **independent** erosion experts that the property owners' concerns regarding erosion are, in fact, accurate and that the erosion is from waves; not created from poor drainage and/or interruption of plant growth on the slopes. Such a review must assess the degree of success this project would achieve in realizing its stated goals.

- we have public forums involving the Islands Trust, First Nations, the CRD and islanders, to ensure a favourite swimming, socializing, walking, exploring, bird-watching and recreation site for everyone will not be degraded, blocked or impeded. "

The foreshore application can be viewed and commented on at:

https://comment.nrs.gov.bc.ca/applications?clidDtid=1415573&id=66bba8c1abb6b6002255d533

.....

Thank-you for your attention to this,

Respectfully,

Diana Thompson,
185 High Hill Road, Salt Spring Island, BC V8K 2N6

*I have edited the comments in the pages I am presenting to you,
as some were defamatory to the property owners.

Name	Comment
diana thompson	"I love this beach and all it's inhabitants. I believe there are less damaging ways for the homeowners to protect their property."
Maureen Moore	"This natural area is rich and biodiverse. It needs to be protected. I have seen the midshipmen fish there and they are so plentiful and need their habitat."
Tanis Wilkie	"I support a thorough investigation as outlined in this petition before such a drastic action is undertaken."
Brooke Angela	"This beach is a sensitive ecosystem that supports animals and plants, many of which are at risk. Applicants have not shown the benefit or cause of such a project for the environment, only for their private properties. We must learn to centre land and the animals and people it supports above private wealth and its interests. As climate change becomes more and more drastic we are all feeling concerned for our personal interests. To move earth in service of the concerns of a few, and at the peril of the natural environment, is a dangerous precedent already set many times over by our colonial history. We must stop making this mistake."
Frances Hill	"Keep this beach wild and walkable!"
Christina Ross	"I do not want this beach and its marine life destroyed or threatened in ANY way"
Colleen Hamilton	"This is shocking that this would be allowed. Can you imagine the impact if everyone with oceanfront property, took to this method to mitigate the inevitable?"
Debra Krause	"We need to stop interfering with nature and protect fragile ecosystems."
myna lee johnstone	"I care"
Anne McKague	"We humans are continually breaching planetary boundaries. It's time to do everything possible to protect the natural world."
teresa forbes	"I feel strongly about leaving natural habitat alone."
Jacquie Stinson	"I know the history of midshipmen and the importance of their habitat."
harry warner	"It is the beginning of a slippery slope! Protect our beaches!"
Gary McNutt	"because there are so many good reasons for this not to happen."
Damien Barstead	"Not impacting existing native species is paramount."
Brenda Guiled	"Industry comes in, mucks things up, kills things, then leaves when business falls off or fails. Baker Beach, the way it is, is sustaining itself. Leave it be"
Ashley Allison	"I understand what our society is doing is wrong by destroying habitats of different animals species so I want to help make a difference in our society and planet by helping"
Darryl Martin	"Our local ocean environment is important to me. I swim and snorkel at this location."

John Davies	"Leave our rare natural beach alone, it is besutiful."
Cindy Rabson	"I care about our environment"
undine Thompson	"Biodiversity is priceless and essential."
Claire Siega	"Civilians deserve shoreline access"
Adonis Chamberland	"Lets keep nature for everyone else and not destroying the habitat"
Mike McCann	"Want to Preserve Salt Spring Island Humans have to stop interfering with the Natural order of Mother Nature to suit their Agendas"
Emma Yeates	"This is not okay"
Miriam Reid	"I love this beach. The wording on this "application" shows how sneaky they are. "Green" and "nutrition" are not words that go with 28 dump trucks of small pea gravel. Please don't fall for this application by 6 homeowners. If you buy beachfront you need to plan for climate change. It's not the public's job to protect your investment. Get real."
Olga Parkomenko	"I am not supporting the destroyment of the beautiful nature of our island by rich landowner,, only because they have money the can not rule the world!!!"
Susan Pearson	"This is just wrong. Breaks my heart that only a few will be able to use this beach if this goes through. Sad."
Sam Mitchell	"I think the environmental implications need to be investigated and respected and the actual cause of the erosion."
Juliet Brown	"How can a group of people possibly take over Crown Land? This is a sacred and incredible special Oasis for the community. This is not a 'transformation', it is a DESTRUCTION! Please don't allow this to happen, the wealthy trying to take what should not belong to anybody. This area needs to continue being enjoyed and respected by the community. Doggy play dates, swimming, bioluminescence, beach fires, star gazing, kayaking, diving, dancing, connecting with nature. Please don't allow them to destroy it!!"
Jane Squier	"this is a special and well loved natural beach which should be left intact to maintain its biodiversity as well as it can."
Richard Veenhof	"I don't think that the proposed beach 'nourishment ' will address the issue of soil erosion on the high bank waterfront properties. It will alter the natural coast line forever though and that seems like it should require 3rd party research in to the matter."
Danielle Baragar	"Fish and habitat matter!"
Claudia French	"It's a lovely beach and hope there's something else that can be done."
marcelle Roy	"save these rare fishees' habitat!"
Patricia Faurot	"We are supposed to be protecting our natural environments, not altering them."

Sarah Jang	"I use to live in saltspring and have many childhood memories there. It is important to preserve pieces of our island."
Christine hrvatin	"It matters and To save the world one little spot at a time."
Gary Bywater	"We must protect our sensitive ecosystems and the creatures that depend upon them and for the benefit of future generations"
Maxine Leichter	"This is an important area to protect."
Susan Hannon	"I read the documents submitted by the applicants and did not see a full evaluation of the ecological impacts of this project. Not did I see any consultation with affected First Nations."
Josephine Fletcher	"It is an ecosystem. It is not to be interfered with. Simple.Stop."
Mel Ferrabee	"I love and go regularly to Baker Beach. I think the proposed alterations to it are far too intrusive and damaging to the ecosystem.m and natural beauty."
Es Warwick	"Leave it alone!"
Anke Smeele	"The existing foreshore and native species are a unique habitat which could be destroyed by this action."
Kathleen Maser	"It is unthinkable that this project, so destructive to shore life, should proceed."
arlene mason	"We've done enough damage."
Marie Cyr	"I love Baker's beach!!"
Ashley Carter	"I live on Salt Spring island near Baker beach and walk the beach regularly. This would be a disruption to the ecosystem and environment."
Jennifer LeBlanc	"Our marine life and waterfront need to be protected against overdevelopment."
Susan Leibik	"I care about life"
Hana Kamea	"I AM A LOCAL RESIDENT ON SALTSPRING ISLAND AND THE ENVIRONMENT IMPACTS OF THIS PROPOSED DEVELOPMENT SEEM POTENTIALLY ABSOLUTELY DEVASTATING AND CRUCIAL TO ADDRESS BEFORE ANYTHING IS APPROVED. ITS 2024 SURELY THERE ARE OTHER WAYS TO BUILD BESIDES THIS KIND OF LANDFILL."
Lisa Jarvis	"I'm worried that the changes made in the beach will negatively impact the ecology of Baker Beach and maybe even beyond the beach itself."
Nancy Wigen	"The Islands Trust mandated is to preserve and protect the unique ecology of these islands. The intertidal zone of Baker Beach would be irreparably damaged by covering it with a thick layer of gravel and stones. All marine life on this beach would be smothered and killed. Our responsibility and stewardship of this should prevent this from happening."
mona Fertig	"It is hubris to dramatically affect the rare and natural ecosystem of a wild public beach beloved by many islanders, without serious community consultation, scientific and otherwise."

Dulcy Wilson	"We need to protect our fragile ecosystems."
Heather Martin-McNab	"I love Baker Beach as it is in its natural state. The addition of truckloads of gravel would cause environmental harm to shore life."
Trevor May	"I am a concerned neighborhood resident."
Alinka Porebska	"I live on salt spring island and visit this beach regularly. I am concerned about the impact this will have on the ecosystem."
Wendy Kloiber	"I have a good friend who lives on Salt Spring. I care about the ecosystem. Interfering with the natural balance, is almost never a good idea."
Pete McKenzie	"People should accept that buying waterfront property comes with hazards ! The beaches are not theirs to modify."
Seth Klapman	"until the impact of this proposed resculpting of the shoreline is determined, any alteration is a potential threat to the eons-old life forms that were here long before us. Thinking "Seven Generations" forward and back!"
Terry Curell	"This is a wonderful beach. Very geologically interesting. It's even cooler now that I know there'll be a musical accompaniment!"
Alida De boer	"I want to protect and keep enjoying the beautiful beach"
wendy hamilton	"Unjustifiable and incomprehensible to disrupt and damage the existing beach environment & ecosystem to satisfy the private real estate interests of a few wealthy property owners."
jeff Alexander	"We need more beaches like this, if only to have more places where we can rejuvenate ourselves away from the hustle and bustle of everyday drudgery."
Hannelore Pinder	"Saltspring Island is a treasure, and we shoul really check every possible danger the could arise from our interfering with the natural habitat before we do it"
Brandy Beamish	"I have friends and family that live there so I visit often and it's a beautiful place and should remain that way"

LOCAL TRUST COMMITTEE

Response to proposed Baker Beach Shoreline Modification initiative
[Crown Land Tenure Application (Tracking Number 100439391)
Land / Foreshore Use Application: Shoreline Erosion Mitigation
and DFO Request For Review: *Baker Beach Green Shore Mitigation For Backshore And Foreshore, Salt Spring Island*]

Submitted by the Nature Salt Spring Steering Committee
David Denning, Kathleen Maser, Peter McAllister, Jean Wilkinson, Giselle Paquet, Pat Miller, Gail Bryn Jones

Nature Salt Spring is a grassroots organization on Salt Spring Island dedicated to nature education, conservation and restoration of natural ecosystems on Salt Spring and the Gulf Islands. We have examined the proposal for foreshore modification at Baker Beach (Tracking Number 100439391) as well as the DFO Request for Review Document, and we strongly object to any alterations involving intertidal areas of Baker Beach.

We agree with land-based remediation, but strongly oppose the proposed intertidal modifications:
We believe it is inappropriate to consider major industrial-scale modifications of the intertidal areas at Baker Beach described in these project proposals. Instead, we support a staged approach that would only allow **consideration** of significant beach modifications several years after all land-based remediation work has been implemented and thoroughly assessed.

We have concerns that the intertidal industrial-scale modifications proposed by this project will damage the integrity of the intertidal beach ecosystems and extensive near-shore eel grass bed ecosystems, both as a consequence of moving and placing materials on the beach and the long term effects of materials redistributing out across the intertidal areas. We feel that the recreational, educational, and nature-watching values of this beach are not available on any other beaches/shorelines of Salt Spring Island, and they should be preserved in their natural form. Our view is that the proposed intertidal modifications have a high likelihood of damaging a fish-nesting habitat as significant as any forage-fish habitat.

On the other hand, we enthusiastically support the approach of above-shoreline remediation efforts, and would be happy to work with the Transition Salt Spring Native Plant Stewardship Working Group and other organizations to help in promoting these above-shore remediation efforts.

Baker Beach is a Spectacular and Unique (to Salt Spring) Wildlife–Fish Interaction Hot Spot
Baker Beach is popular spot to visit at low tide, particularly for families that appreciate exploring intertidal life, and for bird watchers and other nature enthusiasts who appreciate our large avian species such as Bald Eagles and Great Blue Herons. During the months of May–July this section of Baker Beach is a hot bed of Bald Eagle and Great Blue Heron activity.

We are especially concerned about the potential for altering or destroying this spectacular wildlife display that is dependant on a nesting fish – the Plain-fin Midshipman, (Porichthys notatus) hereafter referred to as Midshipman or PFM. To briefly summarize the remarkable aspects of PFM life history, as they relate to the rocky intertidal shoreline of this proposed development:

- PFM males swim up from the depths of Sansum Narrows in April/May to establish nests under intertidal rocks. Males will occupy these nests and guard eggs for 2-3 months.
- Nesting sites require specific conditions – suitably-sized, and suitably-shaped rocks sitting on a suitable substrate allowing the fish to hollow out and maintain a pocket nest under the rock.
- In the western Salish Sea region, there are probably less than 10 'hot spots' of PFM nesting with nest densities >100 nests/km. [1].
- Baker Beach is a 'PFM nesting hot spot'. Surveys in 2019 and 2022 revealed 113±20 PFM nests in one kilometer of shoreline that includes the 800 meter proposed shoreline development.
- As part of an extensive study of Sea Star Wasting Disease on Salt Spring Island, we also surveyed most of the beaches on SSI that appear to have suitable PFM nesting habitat. While a few scattered PFM nests were found elsewhere, the evidence at this point suggests that Baker Beach is the only PFM nesting 'hot spot' on SSI.
- One significance of a PFM hot spot is that both adult male and female Midshipmen are frequently moving to and from nests along the shore where they are vulnerable to predation by Bald Eagles, Great Blue Herons, Northern Crows Glaucus-Wing Gulls and other birds. Studies have shown that PFM are the primary provisioning food for nesting eagles and Great Blue Herons in many Salish Sea regions. One study estimated that over 22,000 PFM were consumed by nesting eagles in the Cresent Beach, White Rock, Delta, Surrey area in one single May-July breeding season. [2]
- Studies show that PFM nests contain, on average, 400-500 yolky eggs glued to the ceiling of the nest cavity where they develop into swimming juveniles. This indicates that as many as 40,000-50,000 new PFM juveniles may escape as hatchlings from Baker Beach each year.
- We also note that despite the seeming resilience of a fish that nests in the intertidal, these fish can be extremely vulnerable. We carried out a short survey in July 2021 about 2 weeks after a severe 'heat dome' in which air temperatures exceeding 40° C during the lowest tides of the year. The survey of 11 nests revealed that egg masses in all nests had been destroyed by the heat. The survey suggested that an entire cohort of PFM offspring was wiped out by the 2021 June heat dome. We are extremely concerned that movement of "nutrient" particulate materials placed at the top of the beach will lead to diminished nesting habitat for PFM, and loss of this valuable food cycle for aerial wildlife and other ocean life.

Above-shoreline approaches to remediation

We believe that thorough implementation of nature-based mitigation solutions directly on the slopes of greatest concern above Baker Beach **should be carried out before any modifications at the beach level would even be considered, NOT CONCURRENTLY. As noted in the DFO Request Document** (Request for Review: *Baker Beach Green Shore Mitigation For Backshore And Foreshore, Salt Spring Island*) **these would include:**

- Bioengineering and Re-vegetation
- Remove invasive species along the backshore and re-plant with native species at a high density. Irrigate until established.
- Enhancement of backshore vegetation through planting of native species, particularly overhanging species such as Oceanspray. This is included in the detailed design plan with specific plant species, locations, spacing, methods of planting and maintenance.
- Maintain the current natural beach slope to the extent possible.

We strongly support these remediation approaches, although with the following caveats:

- Timing, extent, and species selection for invasive species removal should approached with great caution. To the extent that invasives are helping with soil retention at the current time, they should be replaced according to best invasives control practices.
- Native vegetation options for slope remediation control include a large number of species in addition to Ocean Spray. In particular, Snowberry, Red Osier Dogwood, Saskatoon Berry, June Plum, Red Flowering Current, Nootka Rose and other native roses are ideal due to their relatively sizeable root development but reduced water demands compared to trees such as Douglasfir and Arbutus.
- We enthusiastically support the idea of hiring locals to carry out this remediation work, in order to establish a larger pool of natural vegetation remediation businesses and workers on the Island

A second major issue, and one that again requires study and possible implementation **before considering any modification** of Baker Beach, is the indication that water retention in the slopes leading down to the beach has been modified by the construction of houses on the slopes/benches above the beach. We feel that a thorough study of the relationship between water retention and slope movement may suggest alternatives such as water flow control. This would help in guiding native species remediation and would significantly affect decisions about whether to continue with requests for beach modification.

Addendum to: Points to be brought to the November 14, 2024 LTC:

This section includes several links for Trustees and the Planner. In addition, there are more thoughts, observations and opinions submitted to me by people who are interested in keeping Baker Road Beach as wild and natural as possible. Other attachments will accompany this addendum.

- Has the LTC asked the planner (Shogo) to consult with the Islands Trust Conservancy? A covenant on the beach could provide guidance and assured protection. Or could the beach become a Park Reserve? Once a beach is engineered, it is always an engineered beach. There's no going back.

Erosion –

- Reading the Geohazard Assessment you can see it accurately understands that it's the water from above not below that causes the bluff to erode. But it is considered a "feeder bluff" providing the little amount of small rocks and sand etc. that forms the 'beach' so perhaps stopping that accumulation it could damage the fish' habitat or eelgrass etc. The assessment describes in detail just how small that area is, and that the logs presently there are helpful though temporary (and why in other locations, affixing the logs to the bluff has been a successful, low-impact mitigation technique).

- See Attachment: Use for LTC Log Protection Native Plants. Alternative ways to secure woody debris, combined with bioengineered steep slopes should be looked at. No intrusion into the intertidal zone. The rock outcrops and woodsy protection might serve well.

Placement of rocks proposed to "mimic" existing rocks:

- not sure how or if they would do anything at high, spring tide times
- Concern that they would be blocking the ability to walk at high tide as well as low tide.
- What about the open water for swimming, kayaking, paddleboarding, etc.
- Proposed "loaves " = Beach Terraces to cover 380 m. of beach. Is the aggregate actually concrete without the hardening? How will nourishment get through from above?
    - A1 L= 70m x W=5m x H=1m
    - C1 L= 110m x W= 5m x H=1m
    - E1 L= 115m x W= 5m x H=1m
    - F1 L= 85m x W=5m x H=1m

Midshipman fish – An islander who grew up on Booth Bay said as kids they called them the "Croakfish". And yes, they were all around Booth Bay, south side, too. How has the low-bank changes to the entry to Booth Canal affected spawning?

Language – can be used in misleading ways.

- BC Geen Shore program is not involved. Can they do an assessment? Or can BC Sustainability?
- Small machine using vegetable oil (on website by applicant)?
    - What is the size of the 'machine'? Toaster? Car?
    - Would the barge bringing the aggregate be using vegetable oil? What impact would the barge have on the waters offshore, the eel grass? Danger of spillage?
    - What does that matter anyway – there would still be impact on the foreshore and the spawning grounds?
- Nourishment (the "loaves" have potential of both blocking nourishment from above? as well as)
- Spring tide vs. King tide (a non-scientific term). Using King tide gives an unnecessary feeling of urgency.
- The plan admits there would be particle migration from the proposed beach terrace.
    - How often would more material be needed? Perhaps at regular intervals to maintain the beach terraces. Each time there would be a major intrusion of a barge and excavator. Over a 50-year timeframe, the dissipated material will likely end up spreading over the entire intertidal zone.
    - What would stop dogs and children from digging on the 'loaves'? That activity would dislodge material and potentially harm the beach in unforeseen ways and hasten the need for re-building?
    - The volume of aggregate is greater than outlined in the proposal.
    - The shellfish and fish habitat cannot but be affected.

- From Quarry steps to Baker steps, almost all the back shore is rock-exposure at the toe of bluff, some as high as 2m. This rock will erode very slowly, perhaps a few cm. per decade? No one has actually measured the rate that I know of.
    - **It seems the proposed gravel terrace will do little to change this, and nothing to support the steep soil banks above.**
    - **Several years of study should be done before any POTENTIALLY intrusive measures are taken.**

- The reports admit the upper soil slopes are vulnerable to effects of the ground water flows (pore pressure).

- Working to control all water collected by human-installed systems (like ditches, septic fields, roofs and perimeter drains) would be most effective in slowing or eliminating soil slope movement. Also, having bioengineered steep slopes could mitigate erosion. These ideas are not mentioned in reports, even though several owners nearby have already done some of it.

- These slopes have been stable for hundreds of years. The geotechnical aerial survey showed no signs of historic landslides.
  - The only real change in the last 75 years is human occupation, which may have changed the groundwater regime by diverting and concentration rainfall.
  - This in turn may affect the bluff slopes, and perhaps shown in more trees topples.
  - **It has been suggested that there be a study of the whole area** and make sure no adverse pipes or ditches send water toward the cliffs.
  - Deal with this first - no permits needed.

- Speculation points to the recent tree topple 3 winters after one of the houses was built!

- https://www.qathet.ca/wp-content/uploads/2019/12/Your-Marine-Waterfront.pdf **mentions anchoring logs as a possibility**. As that is a commonplace practice (eg.- Witty's Lagoon near Sooke) it seems to make a lot of sense: less intrusive, cheaper, and avoids the horrendous Carbon Footprint of digging up (where), preparing, transporting, and depositing on the beach at more than the proposed 85 truckloads of material. And, big boulders would need the same excavation, transporting and depositing. Would it even help stop the slope from eroding, which the geologist fully understands is due to upland drainage and tree-toppling, etc. for which they have plans including revegetation.

- Any serious research of "Beach Nutrition" shows that it has not been a successful solution over time. The gravel has to be constantly re-filled –at a huge cost – and will eventually move around. It will not stay still. **The potential for smothering the lower parts of the beach is huge.**

- **A beach like this is rare on Salt Spring.** It is a beautiful, long, walkable, south-facing, hospitable and accessible beach, that means just so much to so many people. It is loved

by hundreds who have raised their children and grandchildren on the shores. That is the deep cry I hear

- **The Plainfin Midshipman nesting grounds, eelgrass beds, littleneck clam beds, nesting grounds for forage fish are all vulnerable if this goes ahead. What guarantees can be given that the suitability of the habitat for spawning would be preserved?**

- **Preserve the Wild and Natural in Baker Beach**

- **Bank erosion is caused by ground water, rain weathering and trees falling According to the Islands Trust study the wave action of the sea poses a low erosion risk.**

- **Three Geotech professionals say the houses are at low risk.**

- **Proposed beach terraces and rock clusters will not stop the erosion of the slope, but they could endanger the natural life-cycle of the marine life especially the Midshipman fish's spawning nests**

- **A joint study by Washington USA and BC on Sustainable shorelines suggest it is better to allow shorelines to function naturally than to make changes that may negatively impact the beach environment.**

- **What guarantees do the people of Salt Spring have that the proposed extensive work on the public beach would not harm the marine life or impede the use of this beach.**

- **Does the risk of private properties monetary value outweigh the value of the marine environment and the use and enjoyment of the beach?**

- **Locating residences and structures away from the slope is the most effective way to reduce the need for shoreline protection. Should there be a Bylaw requiring a certain setback from the edge of a bluff?**

- **This project should be put on hold until other less invasive measures can be found that protect the public foreshore**

- **Log placement to support the slope has been effective**

- First, **"beach nourishment" has nothing to do with erosion control.** The word "beach" is confounding: It means the loose stuff — sand, gravel cobbles, rocks, etc. (think of a tropical beach) not the mostly-bedrock foreshore of Baker Beach. It's an attempt to maintain these materials when erosion control has stopped the supply of the beach sands and is considered 'sacrificial'. The assessment correctly identifies that the bluff is eroding because of upland fresh water — rain, storms, inadequate or misplaced drainage, trees toppling because of saturated soils, etc. which they are correctly going to try to minimize by dealing with drainage (what about septic tanks?) and planting native plants.

- Even if it was decided that the small amount of beach materials needed some replenishment, "out of an abundance of caution" he decided to account for an extreme sea level rise due to climate change: 0.4m by the year 2100, assuming the worst-case scenario (unabated global greenhouse gas emissions) — then adds on 0.47 m. because some think the Antarctic will melt if climate change isn't stopped! (as if sea level rise is all that will happen — feels like fiddling while Rome burns). And, ironically, there is a huge amount of GHG emitted in all the stages of acquiring and spreading all that material.

- Re: Wave action - there is a 'short fetch" (Van. Island to Salt Spring) which means the swish waves hitting the beach are not as forceful as in open ocean.

- In this document, recommended by Islands Trust, https://www.qathet.ca/wp-content/uploads/2019/12/Your-Marine-Waterfront.pdf, the proposal has completely overlooked the best way to stop erosion — mostly natural, cheap and easy, called **Log Placement**, where all the logs presently there, plus maybe more from the toppled trees, are 'anchored' (so they don't float) by tying or pinning them together, piling up, etc. There is much evidence that not only is this easier, but it also has benefits for the environment!

- Another smaller point is that Green Shores requires the assessor catalogue all the plants presently there. Would salt-water tolerant plants actually be needed?

- The application uses the words '**Pilot project"** that could be used as a model for others'. - **This beach is too sensitive to be used as an experiment nor become precedent setting.**

- Submerged clusters of rock offshore are already **designated PR6 (park)**. In addition, the stairs at Quary Rd. and Baker Rd. are under Parks and Recreation care. **The merits of including the entire 1 km. stretch of beach where Midshipman Fish spawn through the Booth Canal should be explored.**

My 5 minutes:

- **Speaking for myself and the unseen neighbours,** marine life, avian species & botanticals that live on the beach or off the beach. But, there are people present (please stand) who are professional and lay experts on this beach. Many have walked it for over 40 years and know It, have cared for it and love it.
- **Start with my conclusion** – compare to Goldstream – a thriving spawning ground.
    - Can B Rd. B have a covenant put on it? Can it join the 2 submerged reefs PARK RESERVE? Island groups who would support care for the beach?
        - I'm asking that the Planner be refer to ITC about the ecosystem and find a way to place a covenant or possibly Park Reserve designation to the beach. **More partners** might be the CRD's LCC, SS Consev? Trails? Transitions? Nature Salt Spring?
        - **That a meeting be** arranged for the LTC & Planners with local people who have submitted knowledgeable information (HOURS of research has been done by many)
        - **Take the petition seriously** – both the wording of request + the fact that > 1,000 signers in less than a month have asked that Crown Land be protected.
        - Make sure **First Nations are involved** (as of Tues. no info. On section of the application re: consultation)
        - How do we best arrange a study over several years to monitor what needs to be done for the beach? BC Sustainability? A U Vic grad. Student study?
        - Greenshoring is new. Let's be cautious and apply conservatively in sensitive areas.
        - **Use divergent thinking!**
- **Length of beach for proposed work**
    - B.Rd. **Beach cannot be an experiment** or 'pilot' project
    - Habitat for spawning Midshipman Fish, foraging fish, Pacific oysters & crab...eel grass offshore
        - Nutrition for the beach comes from above & logs
        - Once a beach is engineered, there's no going back.
        - Nutrition vs. cement aggregate
    - **The good news:**
        - Alternatives = effective & lower cost – you have received submissions and hopefully, the applicants will consider the options.

- Total support for the property owners first working on their own land (already part of the application).

- **People want to know that any proposed changes can guarantee**:
  - Suitability of the spawning habitat is uncompromised
  - That the recreational use of the beach is left unobstructed
  - That the beach, essentially, be left wild and natural.

Don't it always seem to go that you don't know what you've got 'til it's gone,

Preserve Paradise...and Protect Baker Road Beach.
